The development of coffea schemas

This project was made by the support of IRIS-HEP program

Speaker: Maxym Naumchyk
Mentors: Ianna Osborne, Peter Fackeldey, Iason Krommydas, Nick Smith (listing order is random)

HEP data analysis using coffea

Advantages of a standalone package

- Smaller package
- Only a few dependencies
- Improvements(simplifications) in how the ‘schemas’ work internally (makes it easier for users to create their own ‘schemas’)

Plans of development

- Nanoaod format works with eager(materialized) arrays
- Nanoaod format works with virtual(not materialized) arrays
- Eager and virtual modes are well tested and documented

Currently here ->

- First release
- Awkward-zipper supports all *‘schemas’* from coffea
- Coffea uses awkward-zipper instead of its own *‘schemas’*
- All the new schemas are developed on zipper directly

Thank you for attention!
